Tabatabaenejad, Jeff Thompson, Howard Zebker

Overview

- Objective 1: Combine InSAR and backscatter to measure soil moisture and ALT
 - L-band & P-band
 - Fire, thermokarst, seasonal surface deformation
- Objective 2: Validate with in situ observations

Processing Strategy

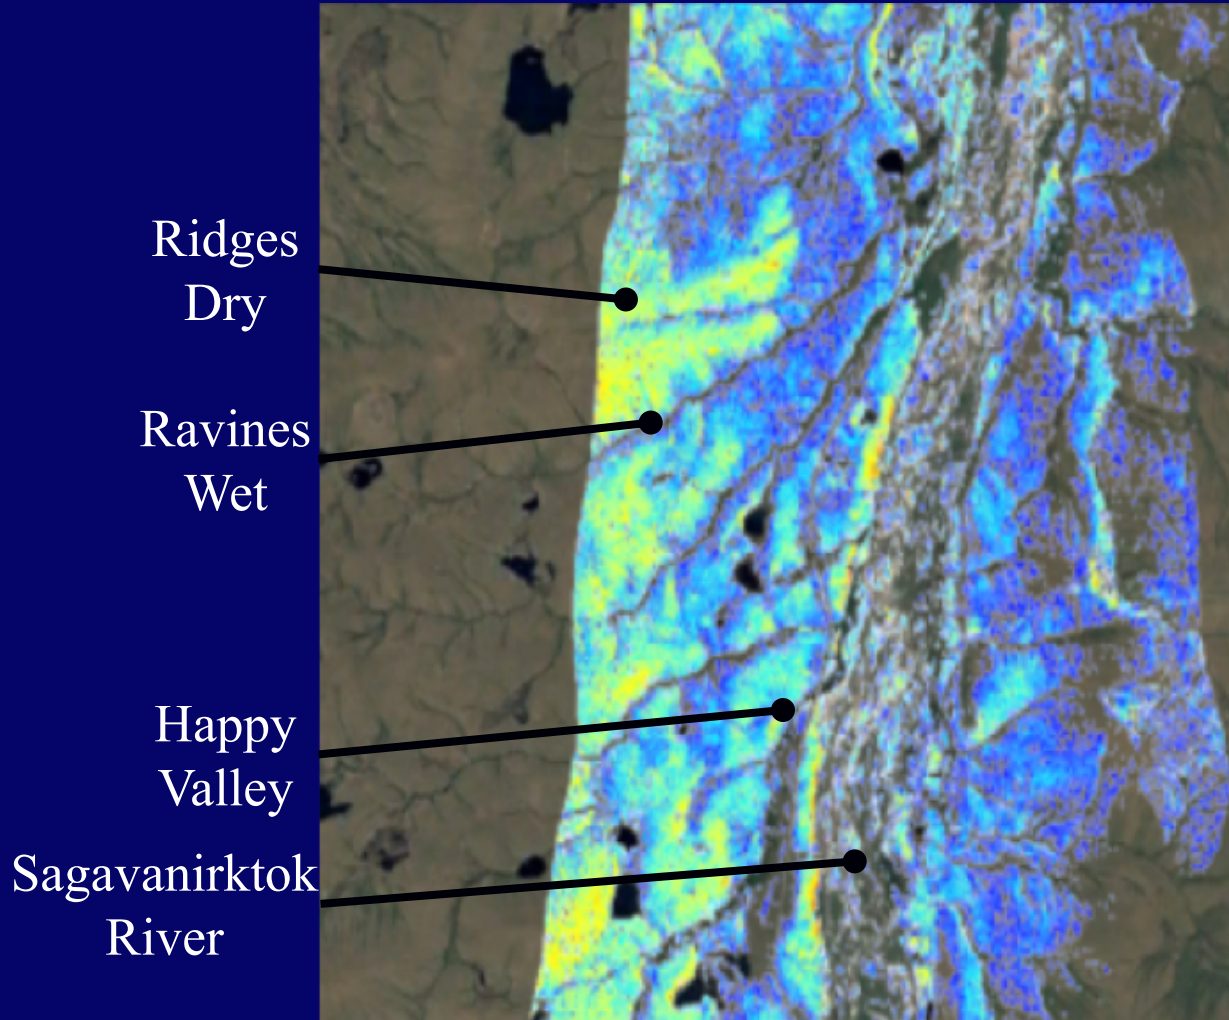

All 90 swaths ★ Pilot Patches

Preliminary Peek: 2015 Fires Yukon-Kuskokwim Delta

Preliminary Peek: Happy Valley, South of Deadhorse

Gathering Validation Data

- Road-Swath intercept strategy
- Soil moisture & ALT multiple techniques

2017 Field Team, Fairbanks, AK

A Typical Survey

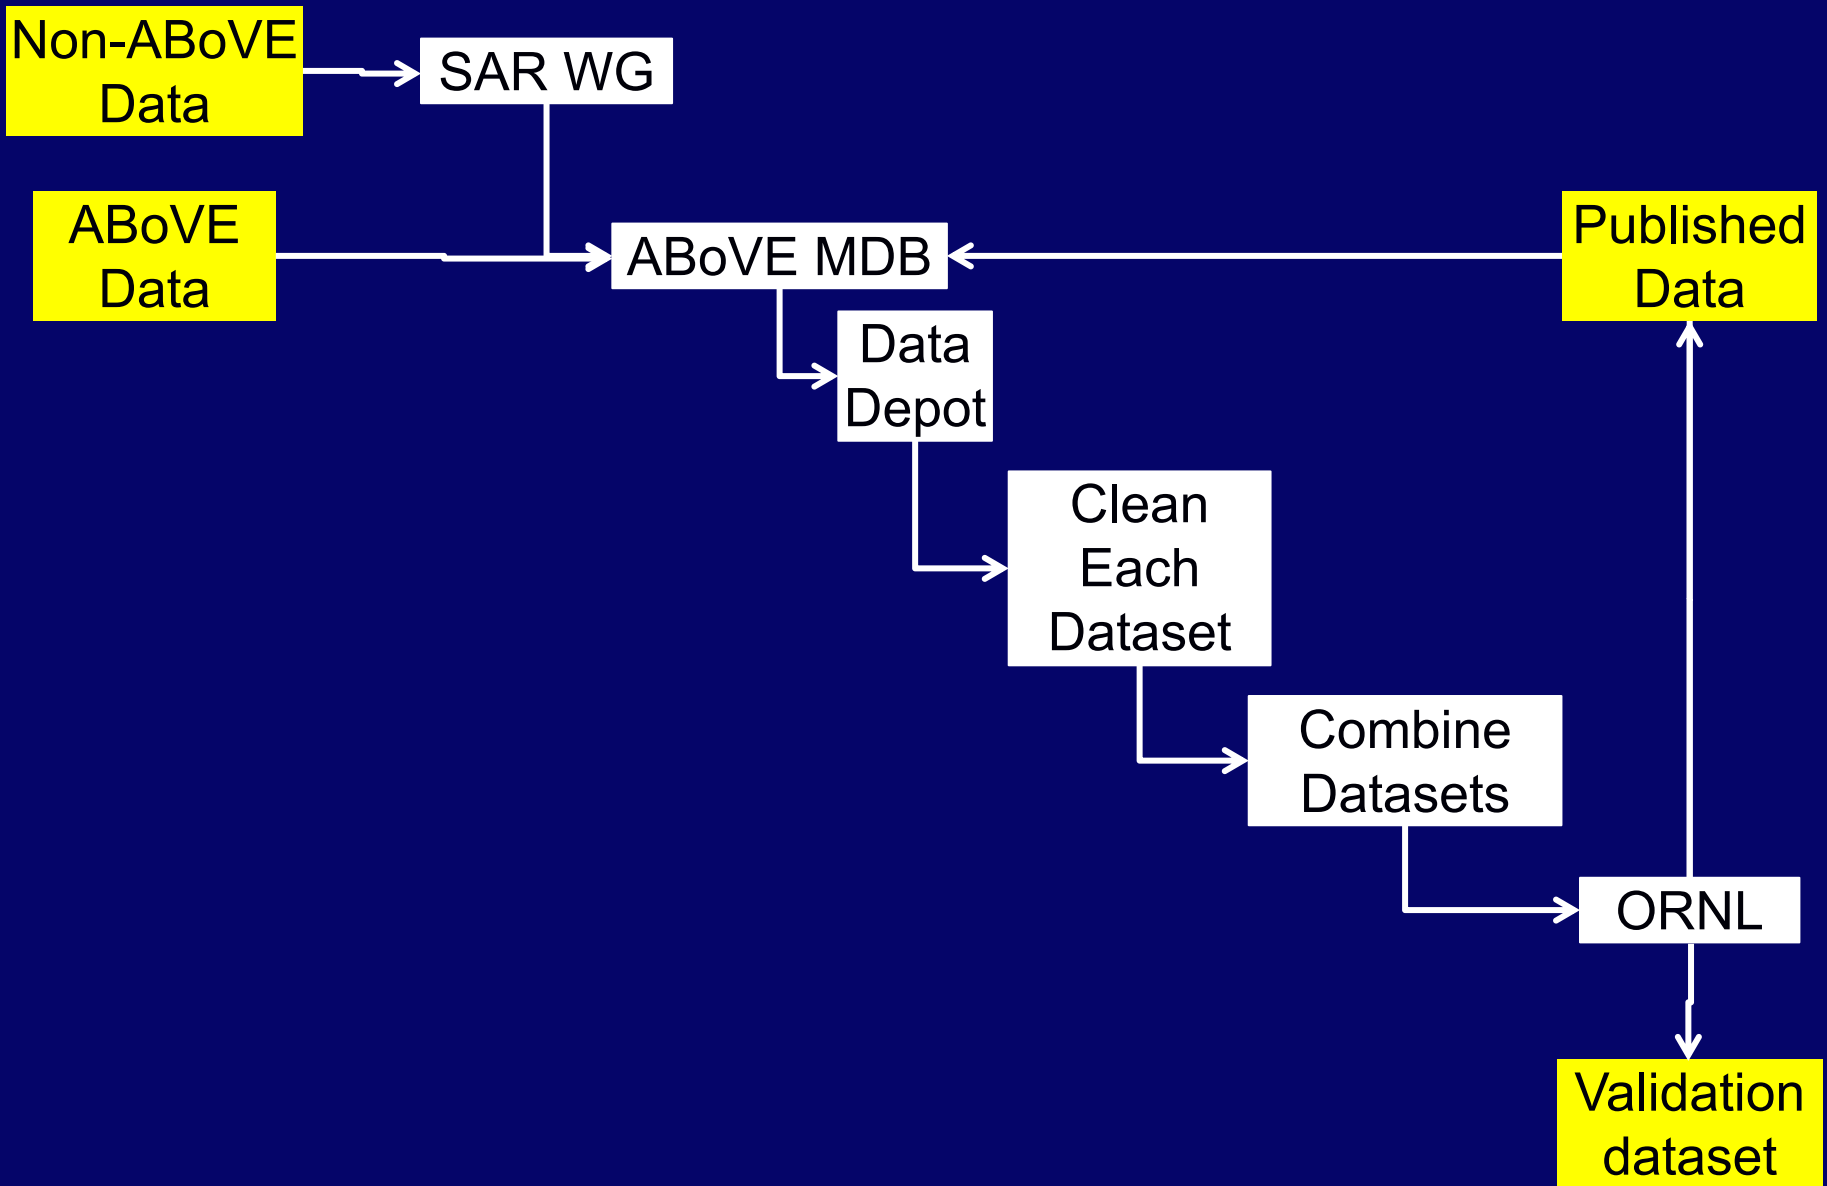

- 20-100 m surveys every meter
- 31 surveys, 1.7 km

SAR Working Group

- 2017: gathering data
- 2018: Integrated Validation Dataset
 - ~ 50 teams
 - ~100 data files
 - ~ 200 sites
- Breakout Session Today

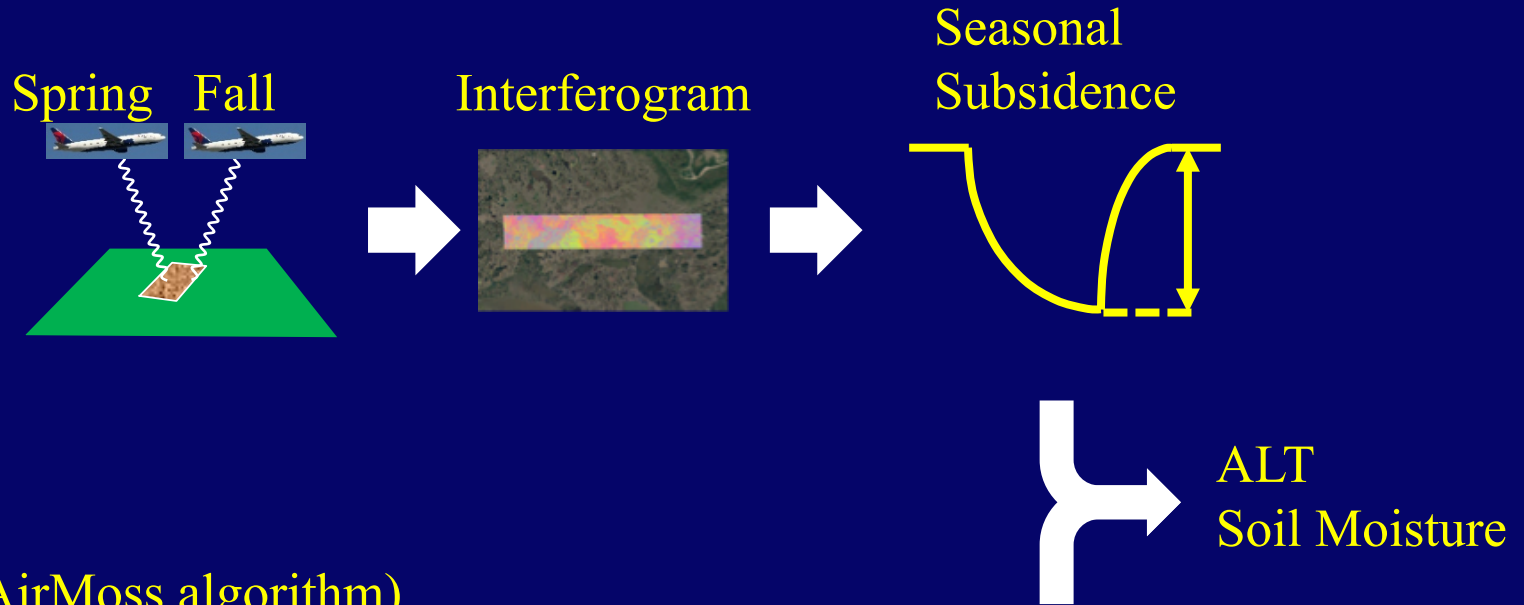

Data Integration Work Flow

The End

Processing Flow

InSAR (ReSALT algorithm)

Backscatter (AirMoss algorithm)

Probing Active Layer Thickness (ALT)

Push into ground

Thumb at surface

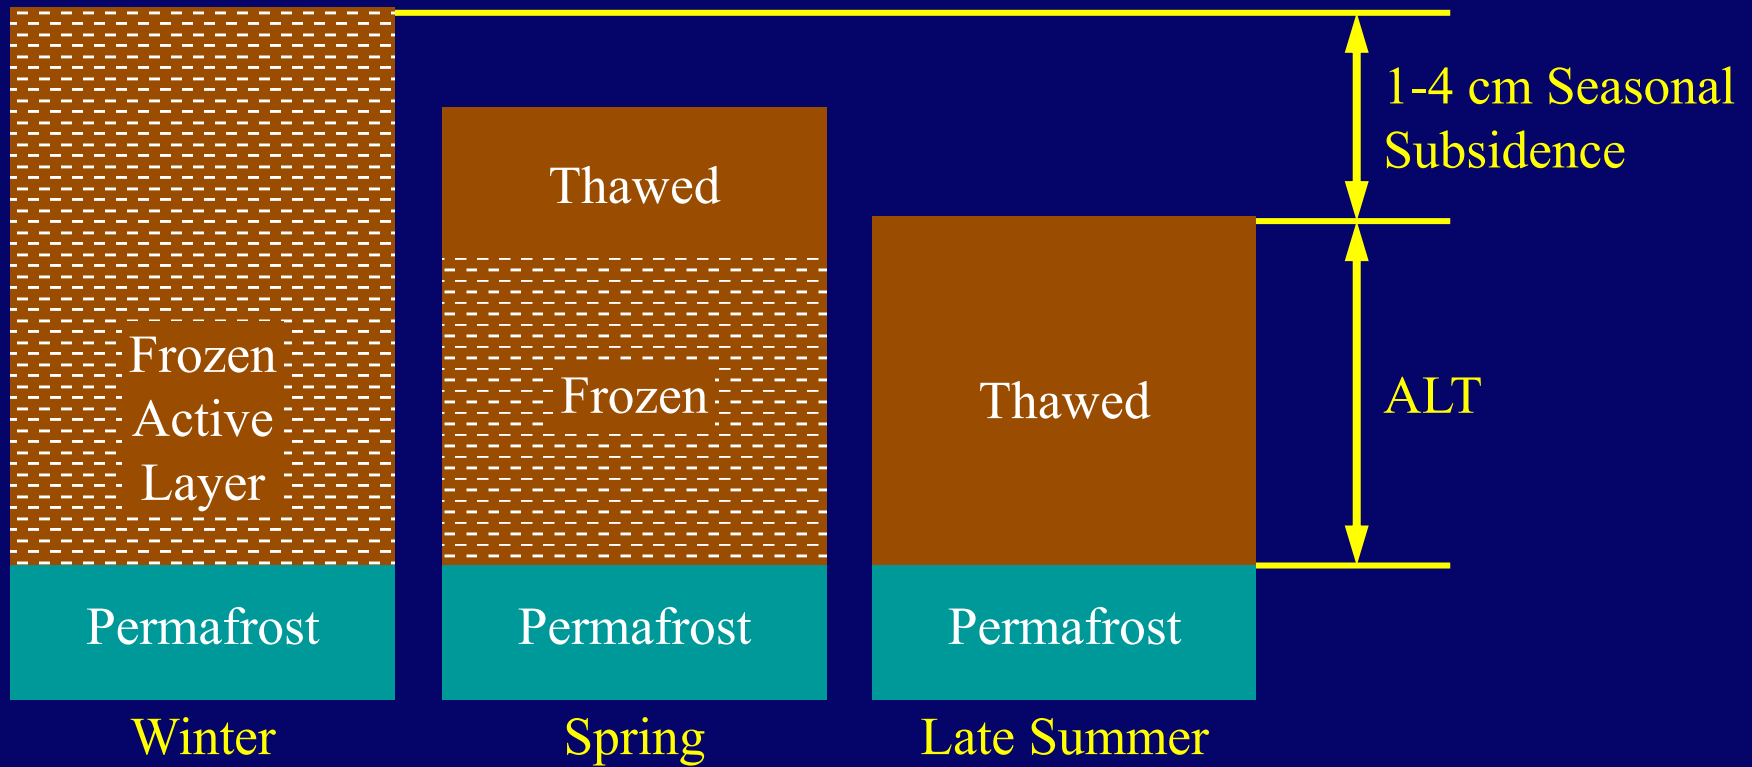

Pull and measure

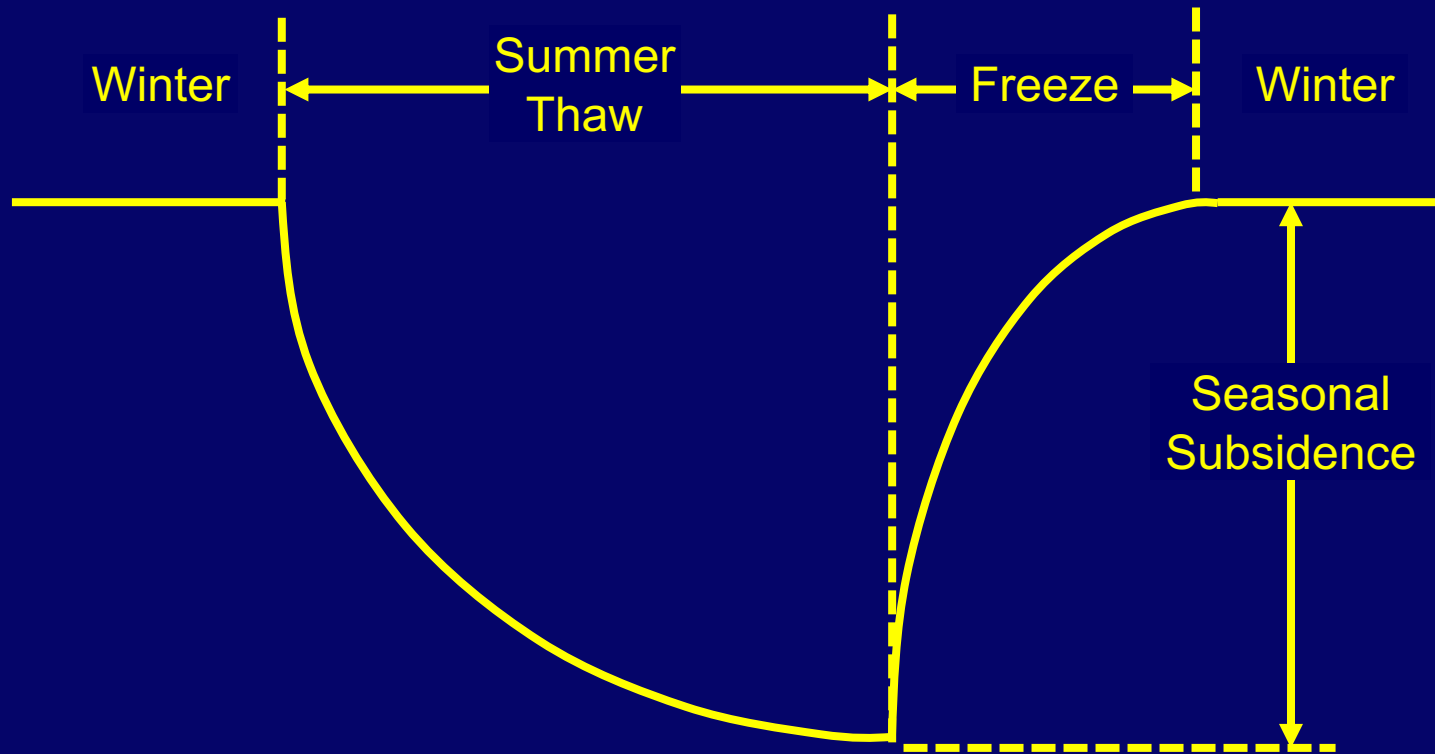

Multi-purpose Probe

Leveraging the Freezing of Soil Water

- Water expands 9% when frozen
- Soil expands ~4% when frozen

Seasonal Subsidence Model

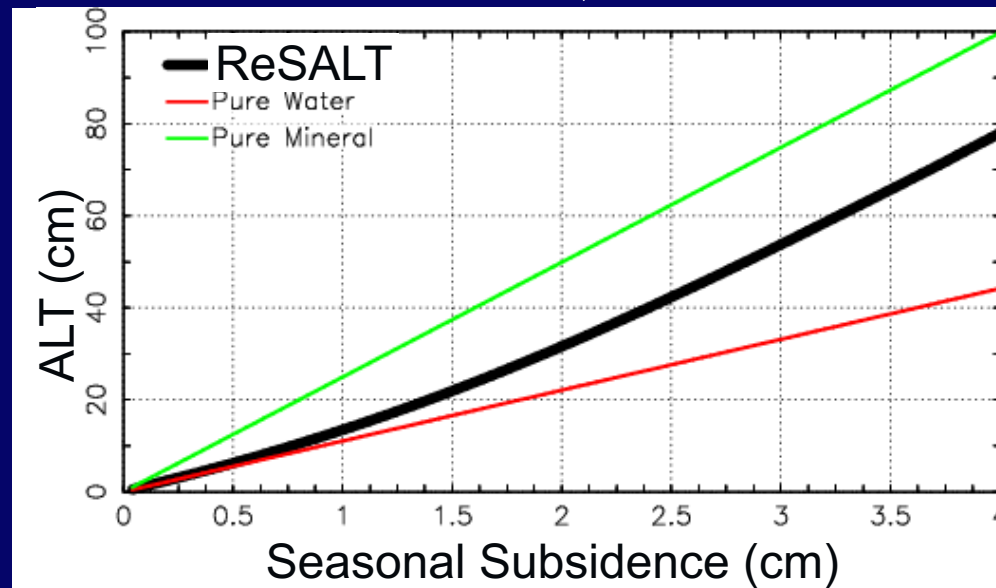

What is InSAR?

- Phase difference between 2 SAR scenes ($\Delta\phi$) to measure relative surface displacement (d)

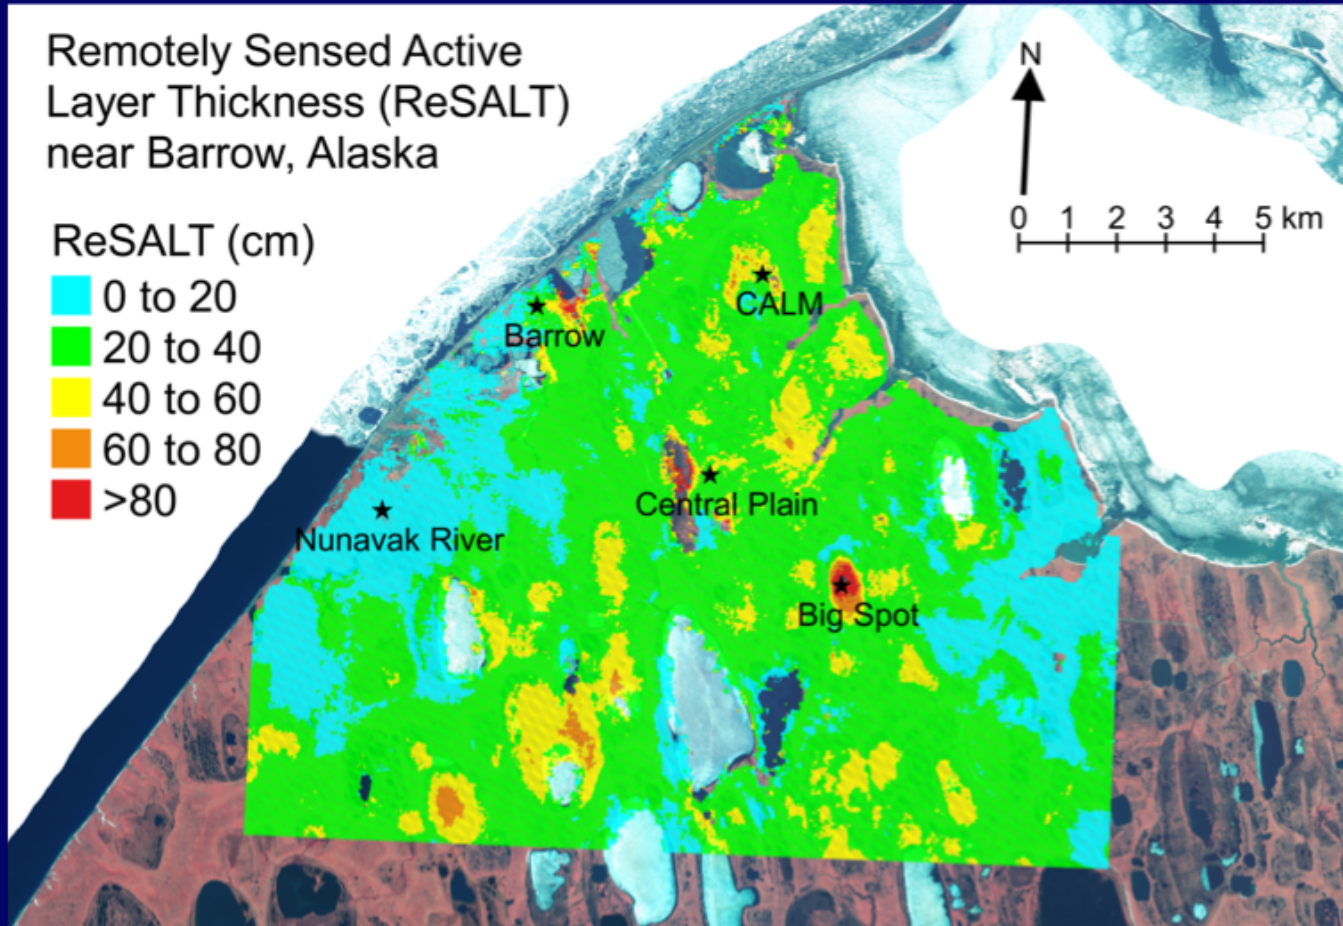

Remotely Sensed Active Layer Thickness (ReSALT)

Interferogram Stack

ReSALT Barrow

ALOS (L-band, 2006-2011)

Lin's Lake, Deadhorse

Visible Image

Seasonal subsidence (cm)

Individual Thermokarst Features

Pipeline Thermokarst, Deadhorse

Subsidence trends (cm yr⁻¹)

Coherence Loss

Yukon-Kuskokwim Delta Fires

Fire Scars from LandSat

ALOS Subsidence trends (cm yr⁻¹)

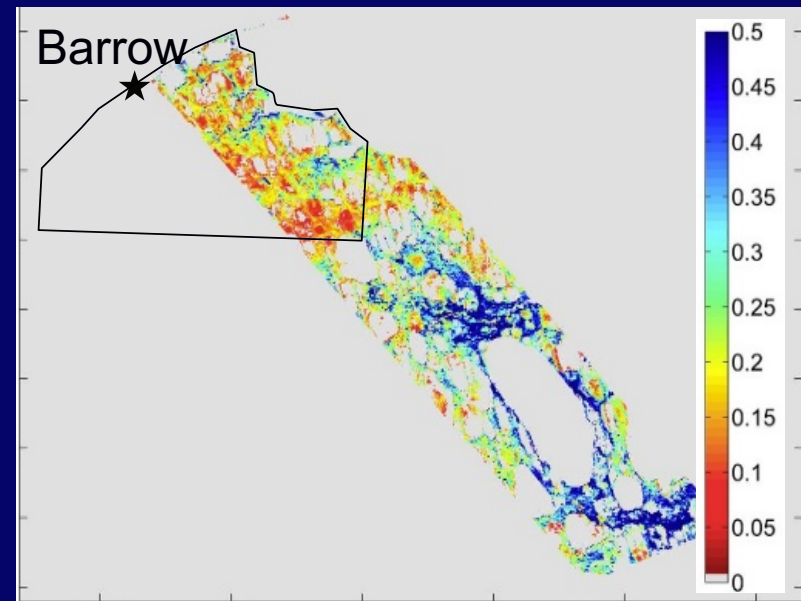

Permafrost Dynamics Observatory

- Combine InSAR and backscatter to measure soil moisture and ALT

ReSALT: ALT from InSAR

AirMOSS: Soil Moisture

Fires Increase ALT

- Reduces insulation by burning organic matter
- Decreases Albedo

Kuka Creek Fire (2015), Yukon-Kuskokwim Delta

Close up of Sphagnum Moss Clump

ALT Increases due to Fire

Kuka Creek Fire, Yukon-Kuskokwim Delta

GPR measurements of ALT

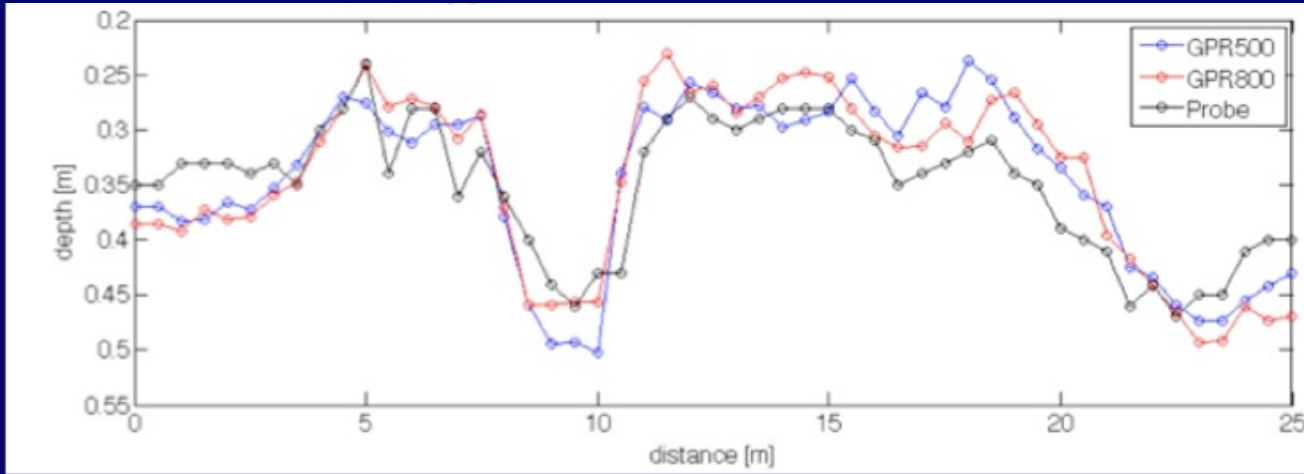

Probing measurements of ALT

GPR Surveys

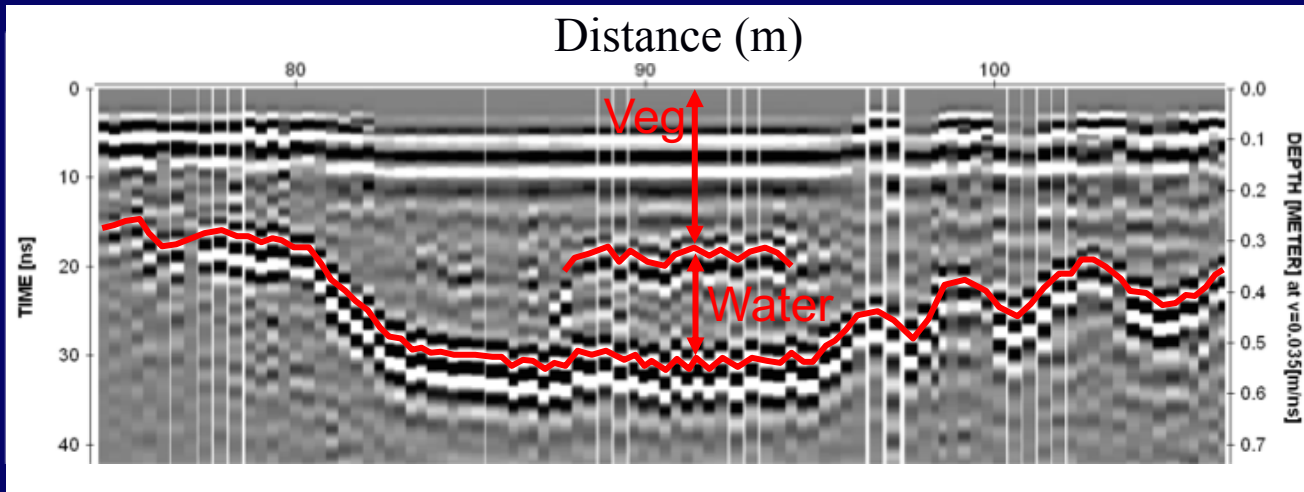

- 500 MHz (60 cm) antenna works best
- 20-30 cm trace spacing
- 2-6 km per day (4-6 hours)

ALT from GPR

Calibration survey, Barrow

Radargram showing floating vegetation mat, Barrow
